

a ReCoMER integrates admitted history and complementary evidence

01 Encode

Independent evidence

a Direct history tokens

Comparison

b Feedback followed by solo-logit fusion

Comparison

c MHnoU: feedback → contribution reassessment → joint inference

a Training: measured marginal contributions supervise the router

b Deployment: local and cross-modal evidence produce bounded weights

a Historical selection and hard admission are separate operations

b Hard rejection removes the historical residual

a cRBEF augments a frozen anchor with calibrated AV evidence

Reference-method reconstruction

a local_current restricts correction to candidate probability mass

Probability sources

$$p(\text{final}) = q + \rho \eta [p(\text{corrected}) - q], \quad \rho = 0.25, \quad 0 \leq \eta \leq 1$$
